## PWM Step-up DC-DC Controller

The NCP1450A series are PWM step-up DC-DC switching controller that are specially designed for powering portable equipment from one or two cells battery packs. The NCP1450A series have a driver pin, EXT pin, for connecting to an external transistor. Large output currents can be obtained by connecting a low ON-resistance external power transistor to the EXT pin. The device will automatically skip switching cycles under light load condition to maintain high efficiency at light loads. With only six external components, this series allows a simple means to implement highly efficient converter for large output current applications.

Each device consists of an on-chip PWM (Pulse Width Modulation) oscillator, PWM controller, phase-compensated error amplifier, soft-start, voltage reference, and driver for driving external power transistor. Additionally, a chip enable feature is provided to power down the converter for extended battery life.

The NCP1450A device series are available in the TSOP-5 package with five standard regulated output voltages. Additional voltages that range from 1.8 V to 5.0 V in 100 mV steps can be manufactured.

### Features

- High Efficiency 86% at  $I_O = 200$  mA,  $V_{IN} = 2.0$  V,  $V_{OUT} = 3.0$  V  
88% at  $I_O = 400$  mA,  $V_{IN} = 3.0$  V,  $V_{OUT} = 5.0$  V
- Low Start-up Voltage of 0.9 V typical at  $I_O = 1.0$  mA
- Operation Down to 0.6 V
- Five Standard Voltages: 1.9 V, 2.7 V, 3.0 V, 3.3 V, 5.0 V with High Accuracy  $\pm 2.5\%$
- Low Conversion Ripple
- High Output Current up to 1000 mA  
(3.0 V version at  $V_{IN} = 2.0$  V,  $L = 10$   $\mu$ H,  $C_{OUT} = 220$   $\mu$ F)
- Fixed Frequency Pulse Width Modulation (PWM) at 180 kHz
- Chip Enable Pin with On-chip 150 nA Pull-up Current Source
- Low Profile and Micro Miniature TSOP-5 Package

### Typical Applications

- Personal Digital Assistant (PDA)
- Electronic Games
- Portable Audio (MP3)
- Digital Still Cameras
- Handheld Instruments

### ORDERING INFORMATION

See detailed ordering and shipping information in the ordering information section on page 3 of this data sheet.

# NCP1450A

Figure 1. Typical Step-up Converter Application

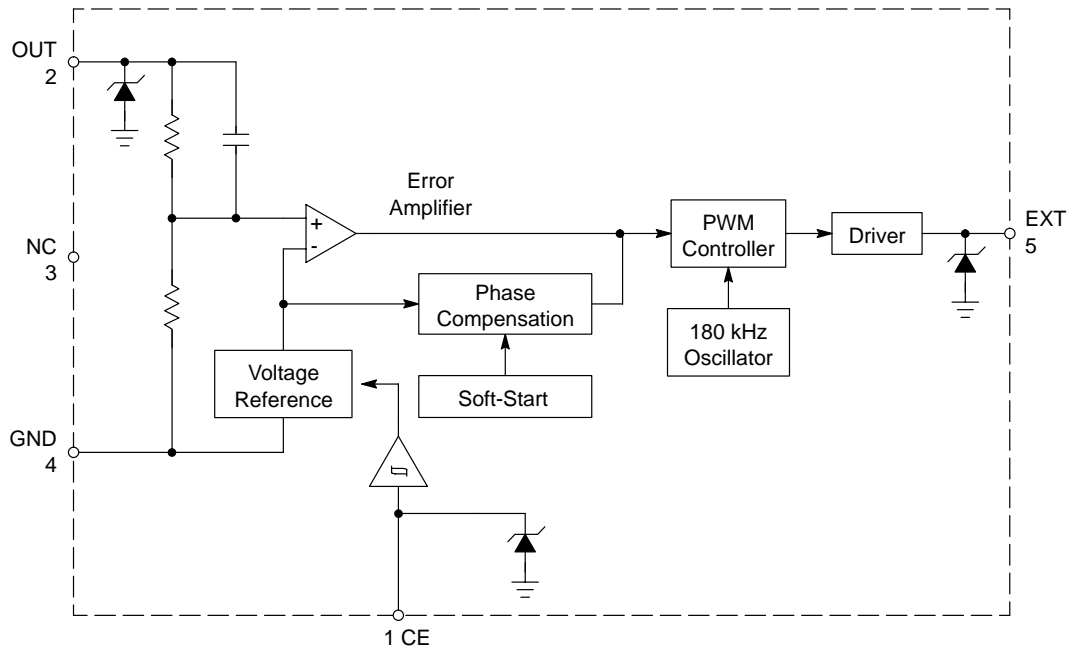

Figure 2. Representative Block Diagram

## PIN FUNCTION DESCRIPTION

Pin #	Symbol	Pin Description
1	CE	Chip Enable Pin (1) The chip is enabled if a voltage equal to or greater than 0.9 V is applied. (2) The chip is disabled if a voltage less than 0.3 V is applied. (3) The chip is enabled if this pin is left floating.
2	OUT	Output voltage monitor pin and also the power supply pin for the device.
3	NC	No internal connection to this pin.
4	GND	Ground pin.
5	EXT	External transistor drive pin.

# NCP1450A

## ORDERING INFORMATION (Note 1)

Device	Output Voltage	Switching Frequency	Marking	Package	Shipping
NCP1450ASN19T1	1.9 V	180 KHz	DAY	TSOP-5	3000 Units on 7 Inch Reel
NCP1450ASN27T1	2.7 V		DAZ		
NCP1450ASN30T1	3.0 V		DBA		
NCP1450ASN33T1	3.3 V		DBC		
NCP1450ASN50T1	5.0 V		DBD		

- The ordering information lists five standard output voltage device options. Additional devices with output voltage ranging from 1.8 V to 5.0 V in 100 mV increments can be manufactured. Contact your ON Semiconductor representative for availability.

## MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Power Supply Voltage (Pin 2)	$V_{OUT}$	6.0	V
Input/Output Pins EXT (Pin 5) EXT Sink/Source Current	$V_{EXT}$ $I_{EXT}$	-0.3 to 6.0 -150 to 150	V mA
CE (Pin 1) Input Voltage Range Input Current Range	$V_{CE}$ $I_{CE}$	-0.3 to 6.0 -150 to 150	V mA
Power Dissipation and Thermal Characteristics Maximum Power Dissipation @ $T_A = 25^\circ\text{C}$ Thermal Resistance Junction to Air	$P_D$ $R_{\theta JA}$	500 250	mW $^\circ\text{C}/\text{W}$
Operating Ambient Temperature Range	$T_A$	-40 to +85	$^\circ\text{C}$
Operating Junction Temperature Range	$T_J$	-40 to +150	$^\circ\text{C}$
Storage Temperature Range	$T_{stg}$	-55 to +150	$^\circ\text{C}$

- This device series contains ESD protection and exceeds the following tests:  
Human Body Model (HBM)  $\pm 2.0$  kV per JEDEC standard: JESD22-A114.  
Machine Model (MM)  $\pm 200$  V per JEDEC standard: JESD22-A115.
- Latch-up Current Maximum Rating:  $\pm 150$  mA per JEDEC standard: JESD78.
- Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J-STD-020A.

## DETAILED OPERATING DESCRIPTION

### Operation

The NCP1450A series are monolithic power switching controllers optimized for battery powered portable products where large output current is required.

The NCP1450A series are low noise fixed frequency voltage-mode PWM DC-DC controllers, and consist of start-up circuit, feedback resistor divider, reference voltage, oscillator, loop compensation network, PWM control circuit, and low ON resistance driver. Due to the on-chip feedback resistor and loop compensation network, the system designer can get the regulated output voltage from 1.8 V to 5.0 V with 0.1 V stepwise with a small number of external components. The quiescent current is typically 93  $\mu$ A ( $V_{OUT} = 2.7$  V,  $f_{OSC} = 180$  kHz), and can be further reduced to about 1.5  $\mu$ A when the chip is disabled ( $V_{CE} < 0.3$  V).

The NCP1450A operation can be best understood by referring to the block diagram in Figure 2. The error amplifier monitors the output voltage via the feedback resistor divider by comparing the feedback voltage with the reference voltage. When the feedback voltage is lower than the reference voltage, the error amplifier output will decrease. The error amplifier output is then compared with the oscillator ramp voltage at the PWM controller. When the ramp voltage is higher than the error amplifier output, the high-side driver is turned on and the low-side driver is turned off which will then switch on the external transistor; and vice versa. As the error amplifier output decreases, the high-side driver turn-on time increases and duty cycle increases. When the feedback voltage is higher than the reference voltage, the error amplifier output increases and the duty cycle decreases. When the external power switch is on, the current ramps up in the inductor, storing energy in the magnetic field. When the external power switch is off, the energy stored in the magnetic field is transferred to the output filter capacitor and the load. The output filter capacitor stores the charge while the inductor current is higher than the output current, then sustains the output voltage until the next switching cycle.

As the load current is decreased, the switch transistor turns on for a shorter duty cycle. Under the light load condition, the controller will skip switching cycles to reduce power consumption, so that high efficiency is maintained at light loads.

### Soft Start

There is a soft start circuit in NCP1450A. When power is applied to the device, the soft start circuit first pumps up the output voltage to approximately 1.5 V at a fixed duty cycle. This is the voltage level at which the controller can operate normally. In addition to that, the start-up capability with heavy loads is also improved.

### Oscillator

The oscillator frequency is internally set to 180 kHz at an accuracy of  $\pm 20\%$  and with low temperature coefficient of 0.11%/°C.

### Regulated Converter Voltage ( $V_{OUT}$ )

The  $V_{OUT}$  is set by an integrated feedback resistor network. This is trimmed to a selected voltage from 1.8 V to 5.0 V range in 100 mV steps with an accuracy of  $\pm 2.5\%$ .

### Compensation

The device is designed to operate in continuous conduction mode. An internal compensation circuit was designed to guarantee stability over the full input/output voltage and full output load range.

### Enable/Disable Operation

The NCP1450A series offer IC shut-down mode by chip enable pin (CE pin) to reduce current consumption. When voltage at pin CE is equal or greater than 0.9 V, the chip will be enabled, which means the controller is in normal operation. When voltage at pin CE is less than 0.3 V, the chip is disabled, which means IC is shutdown.

**Important: DO NOT apply a voltage between 0.3 V to 0.9 V to pin CE as this is the CE pin's hysteresis voltage range. Clearly defined output states can only be obtained by applying voltage out of this range.**

APPLICATION CIRCUIT INFORMATION

Step-up Converter Design Equations

The NCP1450A PWM step-up DC-DC controller is designed to operate in continuous conduction mode and can be defined by the following equations. External components values can be calculated from these equations, however, the optimized value should be obtained through experimental results.

Calculation	Equation
D	$\leq \frac{V_{OUT} + V_D - V_{IN}}{V_{OUT} + V_D - V_S}$
I <sub>L</sub>	$\frac{I_O}{(1 - D)}$
L	$\frac{(V_{OUT} + V_D - V_{IN})(1 - D)^2}{f \times I_O \times DIR}$
I <sub>PK</sub>	$I_L (1 + \frac{DIR}{2})$
ΔQ	$\frac{(I_L - I_O)(1 - D)}{f}$
V <sub>PP</sub>	$\approx \frac{\Delta Q}{C_{OUT}} + (I_L - I_O) ESR$

NOTES:

- D - On-time duty cycle
- I<sub>L</sub> - Average inductor current
- I<sub>PK</sub> - Peak inductor current
- DIR - Delta inductor current to average inductor current ratio
- I<sub>O</sub> - Desired dc output current
- V<sub>IN</sub> - Nominal operating dc input voltage
- V<sub>OUT</sub> - Desired dc output voltage
- V<sub>D</sub> - Diode forward voltage
- V<sub>S</sub> - Saturation voltage of the external transistor switch
- ΔQ - Charge stores in the C<sub>OUT</sub> during charging up
- ESR - Equivalent series resistance of the output capacitor

Design Example

It is supposed that a step-up DC-DC controller with 3.3 V output delivering a maximum 1000 mA output current with 100 mV output ripple voltage powering from a 2.4 V input is to be designed.

Design parameters:

- V<sub>IN</sub> = 2.4 V
- V<sub>OUT</sub> = 3.3 V
- I<sub>O</sub> = 1.0 A
- V<sub>PP</sub> = 100 mV
- f = 180 kHz

DIR = 0.2 (typical for small output ripple voltage)

Assume the diode forward voltage and the transistor saturation voltage are both 0.3 V. Determine the maximum steady state duty cycle at V<sub>IN</sub> = 2.4 V:

$$D = \frac{3.3V + 0.3V - 2.4V}{3.3V + 0.3V - 0.3V} = 0.364$$

Calculate the maximum inductance value which can generate the desired current output and the preferred delta inductor current to average inductor current ratio:

$$L \leq \frac{(3.3V + 0.3V - 2.4V)(1 - 0.364)^2}{180000\text{Hz} \times 1A \times 0.2} = 13.5\mu\text{H}$$

Determine the average inductor current and peak inductor current:

$$I_L = \frac{1}{1 - 0.364} = 1.57A$$

$$I_{PK} = 1.57A (1 + \frac{0.2}{2}) = 1.73A$$

Therefore, a 12 μH inductor with saturation current larger than 1.73 A can be selected as the initial trial.

Calculate the delta charge stored in the output capacitor during the charging up period in each switching cycle:

$$\Delta Q = \frac{(1.57A - 1A)(1 - 0.364)}{18000\text{Hz}} = 2.01\mu\text{C}$$

Determine the output capacitance value for the desired output ripple voltage:

Assume the ESR of the output capacitor is 0.15 Ω,

$$C_{OUT} > \frac{2.01\mu\text{C}}{100\text{mV} - (1.57A - 1A) \times 0.15\Omega} = 138.6\mu\text{F}$$

Therefore, a Tantalum capacitor with value of 150 μF to 220 μF and ESR of 0.15 Ω can be used as the output capacitor. However, according to experimental result, 220 μF output capacitor gives better overall operational stability and smaller ripple voltage.

External Component Selection

Inductor Selection

The NCP1450A is designed to work well with a 6.8 to 12 μH inductors in most applications 10 μH is a sufficiently low value to allow the use of a small surface mount coil, but large enough to maintain low ripple. Lower inductance values supply higher output current, but also increase the ripple and reduce efficiency.

Higher inductor values reduce ripple and improve efficiency, but also limit output current.

The inductor should have small DCR, usually less than 1 Ω, to minimize loss. It is necessary to choose an inductor with a saturation current greater than the peak current which the inductor will encounter in the application.

## Diode

The diode is the largest source of loss in DC-DC converters. The most important parameters which affect their efficiency are the forward voltage drop,  $V_D$ , and the reverse recovery time,  $t_{rr}$ . The forward voltage drop creates a loss just by having a voltage across the device while a current flowing through it. The reverse recovery time generates a loss when the diode is reverse biased, and the current appears to actually flow backwards through the diode due to the minority carriers being swept from the P-N junction. A Schottky diode with the following characteristics is recommended:

Small forward voltage,  $V_F < 0.3 \text{ V}$

Small reverse leakage current

Fast reverse recovery time/switching speed

Rated current larger than peak inductor current,

$$I_{\text{rated}} > I_{\text{PK}}$$

Reverse voltage larger than output voltage,

$$V_{\text{reverse}} > V_{\text{OUT}}$$

## Input Capacitor

The input capacitor can stabilize the input voltage and minimize peak current ripple from the source. The value of the capacitor depends on the impedance of the input source used. Small ESR (Equivalent Series Resistance) Tantalum or ceramic capacitor with a value of 10  $\mu\text{F}$  should be suitable.

## Output Capacitor

The output capacitor is used for sustaining the output voltage when the external MOSFET or bipolar transistor is switched on and smoothing the ripple voltage. Low ESR capacitor should be used to reduce output ripple voltage. In general, a 100  $\mu\text{F}$  to 220  $\mu\text{F}$  low ESR (0.10  $\Omega$  to 0.30  $\Omega$ ) Tantalum capacitor should be appropriate.

## External Switch Transistor

An enhancement N-channel MOSFET or a bipolar NPN transistor can be used as the external switch transistor.

For enhancement N-channel MOSFET, since enhancement MOSFET is a voltage driven device, it is a

more efficient switch than a BJT transistor. However, the MOSFET requires a higher voltage to turn on as compared with BJT transistors. An enhancement N-channel MOSFET can be selected by the following guidelines:

1. Low ON-resistance,  $R_{\text{DS(on)}}$ , typically  $< 0.1 \Omega$ .
2. Low gate threshold voltage,  $V_{\text{GS(th)}}$ , must be  $< V_{\text{OUT}}$ , typically  $< 1.5 \text{ V}$ , it is especially important for the low  $V_{\text{OUT}}$  device, like  $V_{\text{OUT}} = 1.9 \text{ V}$ .
3. Rated continuous drain current,  $I_D$ , should be larger than the peak inductor current, i.e.  $I_D > I_{\text{PK}}$ .
4. Gate capacitance should be 1200 pF or less.

For bipolar NPN transistor, medium power transistor with continuous collector current typically 1 A to 5 A and  $V_{\text{CE(sat)}} < 0.2 \text{ V}$  should be employed. The driving capability is determined by the DC current gain,  $H_{\text{FE}}$ , of the transistor and the base resistor,  $R_b$ ; and the controller's EXT pin must be able to supply the necessary driving current.

$R_b$  can be calculated by the following equation:

$$R_b = \frac{V_{\text{OUT}} - 0.7}{I_b} - \frac{0.4}{|I_{\text{EXTH}}|}$$

$$I_b = \frac{I_{\text{PK}}}{H_{\text{FE}}}$$

Since the pulse current flows through the transistor, the exact  $R_b$  value should be finely tuned by the experiment. Generally, a small  $R_b$  value can increase the output current capability, but the efficiency will decrease due to more energy is used to drive the transistor.

Moreover, a speed-up capacitor,  $C_b$ , should be connected in parallel with  $R_b$  to reduce switching loss and improve efficiency.  $C_b$  can be calculated by the equation below:

$$C_b \leq \frac{1}{2\pi \times R_b \times f_{\text{OSC}} \times 0.7}$$

It is due to the variation in the characteristics of the transistor used. The calculated value should be used as the initial test value and the optimized value should be obtained by the experiment.

Figure 74. NCP1450A Evaluation Board Schematic Diagram 2 (Step-up DC-DC Converter Using External Bipolar Transistor Switch)

### PCB Layout Hints

#### Grounding

One point grounding should be used for the output power return ground, the input power return ground, and the device switch ground to reduce noise. In Figure 73, e.g.: C2 GND, C1 GND, and IC1 GND are connected at one point in the evaluation board. The input ground and output ground traces must be thick enough for current to flow through and for reducing ground bounce.

#### Power Signal Traces

Low resistance conducting paths should be used for the power carrying traces to reduce power loss so as to improve efficiency (short and thick traces for connecting the inductor L can also reduce stray inductance), e.g.: short and thick traces listed below are used in the evaluation board:

1. Trace from TP1 to L1
2. Trace from L1 to anode pin of D1
3. Trace from cathode pin of D1 to TP3

#### Output Capacitor

The output capacitor should be placed close to the output terminals to obtain better smoothing effect on the output ripple.

#### Switching Noise Decoupling Capacitor

A 0.1 µF ceramic capacitor should be placed close to the OUT pin and GND pin of the NCP1450A to filter the switching spikes in the output voltage monitored by the OUT pin.

## MINIMUM RECOMMENDED FOOTPRINT FOR SURFACE MOUNTED APPLICATIONS

Surface mount board layout is a critical portion of the total design. The footprint for the semiconductor packages must be the correct size to insure proper solder connection

interface between the board and the package. With the correct pad geometry, the packages will self align when subjected to a solder reflow process.

## 射频和天线设计培训课程推荐

易迪拓培训([www.edatop.com](http://www.edatop.com))由数名来自于研发第一线的资深工程师发起成立,致力并专注于微波、射频、天线设计研发人才的培养;我们于 2006 年整合合并微波 EDA 网([www.mweda.com](http://www.mweda.com)),现已发展成为国内最大的微波射频和天线设计人才培养基地,成功推出多套微波射频以及天线设计经典培训课程和 ADS、HFSS 等专业软件使用培训课程,广受客户好评;并先后与人民邮电出版社、电子工业出版社合作出版了多本专业图书,帮助数万名工程师提升了专业技术能力。客户遍布中兴通讯、研通高频、埃威航电、国人通信等多家国内知名公司,以及台湾工业技术研究院、永业科技、全一电子等多家台湾地区企业。

易迪拓培训课程列表: <http://www.edatop.com/peixun/rfe/129.html>

### 射频工程师养成培训课程套装

该套装精选了射频专业基础培训课程、射频仿真设计培训课程和射频电路测量培训课程三个类别共 30 门视频培训课程和 3 本图书教材;旨在引领学员全面学习一个射频工程师需要熟悉、理解和掌握的专业知识和研发设计能力。通过套装的学习,能够让学员完全达到和胜任一个合格的射频工程师的要求...

课程网址: <http://www.edatop.com/peixun/rfe/110.html>

### ADS 学习培训课程套装

该套装是迄今国内最全面、最权威的 ADS 培训教程,共包含 10 门 ADS 学习培训课程。课程是由具有多年 ADS 使用经验的微波射频与通信系统设计领域资深专家讲解,并多结合设计实例,由浅入深、详细而又全面地讲解了 ADS 在微波射频电路设计、通信系统设计和电磁仿真设计方面的内容。能让您在最短的时间内学会使用 ADS,迅速提升个人技术能力,把 ADS 真正应用到实际研发工作中去,成为 ADS 设计专家...

课程网址: <http://www.edatop.com/peixun/ads/13.html>

### HFSS 学习培训课程套装

该套课程套装包含了本站全部 HFSS 培训课程,是迄今国内最全面、最专业的 HFSS 培训教程套装,可以帮助您从零开始,全面深入学习 HFSS 的各项功能和在多个方面的工程应用。购买套装,更可超值赠送 3 个月免费学习答疑,随时解答您学习过程中遇到的棘手问题,让您的 HFSS 学习更加轻松顺畅...

课程网址: <http://www.edatop.com/peixun/hfss/11.html>

## CST 学习培训课程套装

该培训套装由易迪拓培训联合微波 EDA 网共同推出,是最全面、系统、专业的 CST 微波工作室培训课程套装,所有课程都由经验丰富的专家授课,视频教学,可以帮助您从零开始,全面系统地学习 CST 微波工作的各项功能及其在微波射频、天线设计等领域的设计应用。且购买该套装,还可超值赠送 3 个月免费学习答疑...

课程网址: <http://www.edatop.com/peixun/cst/24.html>

## HFSS 天线设计培训课程套装

套装包含 6 门视频课程和 1 本图书,课程从基础讲起,内容由浅入深,理论介绍和实际操作讲解相结合,全面系统的讲解了 HFSS 天线设计的全过程。是国内最全面、最专业的 HFSS 天线设计课程,可以帮助您快速学习掌握如何使用 HFSS 设计天线,让天线设计不再难...

课程网址: <http://www.edatop.com/peixun/hfss/122.html>

## 13.56MHz NFC/RFID 线圈天线设计培训课程套装

套装包含 4 门视频培训课程,培训将 13.56MHz 线圈天线设计原理和仿真设计实践相结合,全面系统地讲解了 13.56MHz 线圈天线的工作原理、设计方法、设计考量以及使用 HFSS 和 CST 仿真分析线圈天线的具体操作,同时还介绍了 13.56MHz 线圈天线匹配电路的设计和调试。通过该套课程的学习,可以帮助您快速学习掌握 13.56MHz 线圈天线及其匹配电路的原理、设计和调试...
